

RISK ANALYSIS

BASEL ACCORDS GENERALITIES: I, II & III

Prof. Rosario Ruiz

Mail r Ruizh@iteso.mx

What is the financial system?

MEXICAN FINANCIAL SYSTEM

- The main actors in Mexico's Financial System are
 - Bank of Mexico (Banco de México)
 - Secretariat of Finance and Public Credit. (Secretaría de Hacienda y Crédito Público.)
 - National Banking and Securities Commission. (Comisión Nacional Bancaria y de Valores.)
 - National Insurance and Bond Commission. (Comisión Nacional de Seguros y Fianzas.)
 - National Commission of Retirement Savings Systems (Comisión Nacional de Sistemas Para el Ahorro Para el Retiro)
 - Private Banking Institutions (Instituciones de Banca Privada)

IPAB sustituyó al Fobaproa, el cual se creó en 1990 como un fideicomiso para prevenir contingencias, como las de 1994 y 1995. En 1998, el saldo se convirtió en Deuda Pública

Comisión Nacional para la
Protección y Defensa de los
Usuarios de Servicios
Financieros

SFM - Estructura

FOBAPROA → IPAB

- El Fondo Bancario de Protección al Ahorro (Fobaproa), creado en 1990, surgió como una respuesta para enfrentar posibles crisis financieras, en el supuesto que estas representarán un riesgo a la liquidez de los bancos, en caso de suceder el fondo se utilizaría para comprar las deudas de los bancos y otorgarles capital. (Bancos y gobierno, bonos emitidos para la pagar la deuda)
- Se implementó en 1995 para hacer frente a la crisis y evitar quiebra financiera generalizada; se otorgaron subsidios, compraron deuda de los bancos y se protegió el dinero de los ahorradores.
- Instituto para la Protección del Ahorro Bancario (IPAB) procura que las personas ahorradoras conserven el valor de su patrimonio en caso de que un banco se ubique en una situación de quiebra (400,000 UDIS)

MEXICAN FINANCIAL SYSTEM

- The National Banking and Securities Commission (CNBV) is an agency that is part of the **Federal Government** and whose functions are to **monitor (supervise) and regulate** the entities that are part of the Mexican financial system to achieve its stability, proper functioning, and healthy development. Central Banks and private banking institutions are essential in the financial system.
- Within the financial system, there are many banks, some larger than others. Among all of them, the so-called **Systemic Banks** stand out.

Bancos sistémicos globales (G-SIBs) – Lista 2024 (vigente 2026)

Cargos de capital adicional	Bancos	País / Región
0.5 %	JPMorgan Chase	EE.UU.

Actualización abril 2025

BACKGROUND

- Germany's **Bankhaus Herstatt Bank** case
 - Was founded in 1955
 - Number 35 in importance in Germany, in 1974 it had capital greater than 2 billion German Marks (DM)
 - It was not a huge global bank, but it was very aggressive with extremely exposed positions and a lot of leverage, up to 23 times its capital.
 - Between 1973 y 1974 the dollar experimented high volatility
 - In 1974, I was betting that the dollar would recover, which did not happen (loss of gold backing, US deficits, oil crisis, high inflation among others)
 - In June of 1974, losses for **470 million** of German Marks
 - The Capital on the same date was of **44 million** German Marks

BACKGROUND

- Many Banks bought dollars they didn't get, the bank closed at 16:30 (centre-european hour, 10:30 NY).
- The bank was closed on June 1974, at 16:30 (centre-european hour, 10:30 NY). This closure took place at a critical time of the day, just after the bank had received payments in foreign currency but before it could make the corresponding payments in German marks. Due to the time difference in international currency trading, the banks Herstatt was trading with, did not receive their payments, resulting in significant losses. **Herstatt Risk**

BACKGROUND

- The **Basel Committee was established in 1974**, by the G-10, Switzerland and Luxembourg.
- The purpose was to **restore the confidence and stability** of the international financial system, it issues recommendations and declarations. Central Banks support them but not necessarily verify them.
- **Bank of International Settlements (BIS)** (Bank of central banks). It has a banking supervision committee that issues **recommendations** to the financial community to strengthen the global financial sector. **Basel, Switzerland.**

Emergence to the Basel accords

THE COMMITTEE TODAY

- Now days there are 28 countries
- Three basel accords
 - July 1988
 - June 2004
 - December (2010-2017)
 - Basel IV has not been established in form, although many have called it that, it is rather the completion and compliance with the provisions of Basel III, regarding the calculation of Risk-Weighted Assets. It is actually the final phase of Basel III reforms, the implementation timeline of which extends until 2028.
- <https://www.bis.org/bcbs/history.htm>
- **Basel I: the Basel Capital Accord**
- **Basel II: the new capital framework**
- **Basel III: responding to the 2007-09 financial crisis**

BASEL COMMITTEE MEMBERSHIP

Country/jurisdiction	No	Institutional representative	Country/jurisdiction	No	Institutional representative
Argentina	1	Banco Central de la República Argentina	Corea del Sur	2	Bank of Korea; Financial Supervisory Service
Australia	2	Reserve Bank of Australia; Australian Prudential Regulation Authority	Luxemburgo	1	Commission de Surveillance du Secteur Financier (CSSF)
Bélgica	1	National Bank of Belgium	México	2	Banco de México; Comisión Nacional Bancaria y de Valores (CNBV)

India	1	Reserve Bank of India	Suiza	2	Swiss National Bank; Swiss Financial Market Supervisory Authority (FINMA)
Indonesia	2	Bank Indonesia; Otoritas Jasa Keuangan (Financial Services Authority)	Turquía	2	Central Bank of the Republic of Türkiye; Banking Regulation and Supervision Agency
Italia	1	Banca d'Italia	Reino Unido	2	Bank of England; Prudential Regulation Authority
Japón	2	Bank of Japan; Financial Services Agency	Estados Unidos	4	Board of Governors of the Federal Reserve System; Federal Reserve Bank of New York; Office of the Comptroller of the Currency; Federal Deposit Insurance Corporation

BASEL ACCORD I

- Two fundamental points:
 - Common **measurement** of regulatory capital to mitigate **credit risk**
 - **Minimum solvency ratio**
- Strengthen the banking system and eliminate competitive inequalities between banks
- A minimum capital requirement was established that a banking entity should have based on the risks it faced
- **Capital of 8%** of the assets (for each dollar of credit there must be 8 cents in the capital)
- It is a **capital-risk** relationship, where the capital is classified into two levels: Tier 1 (secure source of financing) and Tier 2 (less secure sources of financing).

BASEL ACCORD I

- Considers a single type of risk "Credit"
- Regarding credit risk, 5 categories are weighted: 0, 10, 20, 50 and 100. The total risk is the sum of the risk weighting by the book value of each asset, it must be fulfilled that the minimum solvency ratio , must be:

$$\frac{\text{Total Cap}}{\text{Risk}} = \frac{\text{Tier 1} + \text{Tier 2}}{\sum_{i=1}^N w_i A_i} = 8\%$$

Nivel 1: Es el componente más seguro y de mayor calidad (reservas de capital, acciones, reservas patrimoniales)

Nivel 2: Capital para absorber pérdidas solo en caso de liquidación del banco (bonos de largo plazo)

- Regulatory Capital / Risk-Weighted Assets = 8%
- **Basel I is a simple standard**, based on a single coefficient. Unfortunately, it proved to be insufficient due to the proliferation of increasingly sophisticated instruments.
- From **1980 to 1996, 133 of the IMF's 181** members experienced financial problems.

Minimum regulatory capital requirements

According to Basel I

Asset groups	Risk Relative Weights (RWA%)	Weights respect exposed amount (EAD)=8%*RWA	Exposed amount (EAD) \$	RMC=8%*RWA%*EAD \$
Group 1 (cash, goverment loans)	0	0	\$ 44,157,000.00	\$ -
Group 2 (independent from central goverment entities loans, weights are local (0,10,20 o 50%))	0	0	\$ 732,000.00	\$ -
Group 3 (OCDE incorporated Banks loans, accounts receivable, etc)	20	1.6	\$ 6,880,000.00	\$ 110,080.00
Group 4 (mortage loans)	50	4	\$ 4,976,000.00	\$ 199,040.00
Group 5 (private sector, off-balance sheet as credit equivalent, etc)	100	8	\$ 25,255,000.00	\$ 2,020,400.00
Total			\$ 82,000,000.00	\$ 2,329,520.00

Minimum regulatory capital requirements

According to Basel I

Regulatory Capital \$ 2,329,520.00

$$\frac{2,329,520}{29,119,000} = 8\%$$

Asset groups	Risk Relative Weights (RWA%)	Exposed amount (EAD) \$	Risk Weight Assets EAD*RWA
Group 1 (cash, government loans)	0	\$ 44,157,000.00	\$ -
Group 2 (independent from central government entities loans, weights are local (0,10,20 o 50%))	0	\$ 732,000.00	\$ -
Group 3 (OCDE incorporated Banks loans, accounts receivable, etc)	20	\$ 6,880,000.00	\$ 1,376,000.00
Group 4 (mortgage loans)	50	\$ 4,976,000.00	\$ 2,488,000.00
Group 5 (private sector, off-balance sheet as credit equivalent, etc)	100	\$ 25,255,000.00	\$ 25,255,000.00
Total		\$ 82,000,000.00	\$ 29,119,000

Now think about...

- 1. Why do you think that despite Basel I, banks continued to experience financial problems? What types of risk were omitted in Basel I?**

BASEL ACCORD II

- Incorporates market risk and operational risk to risk measurements. Consider three fundamental pillars:
- **Pillar I: Minimum capital requirements**, to face market, credit and operational risks.
- **Pillar II: Supervision**, guidelines for supervisory authorities to promote best practices in risk management.
- **Pillar III: Market discipline**, considers disclosure requirements to assess basic capital information, exposure and risk assessment.
- Capitalization index, greater than 8%

$$\frac{\text{Total Capital}}{\text{Credit Risk} + \text{Market risk} + \text{Operational risk}}$$

BASEL ACCORD II

- **Credit risk measurement**

- The Standard method, based on credit risk weights
- Internal method (Based on internal bank ratings)
 - Basic (IRB)
 - Advanced (AIRB)

CREDIT RISK

- **The Standard Method:** prescribes the use of external credit ratings to determine the risk weight of some exposures.
- **Internal Methods:** Based on internal bank ratings
 - **The probability of default (PD)** is a credit rating measure that is assigned internally with the objective of estimating the probability of default (5 years)
 - **Severity, loss given default, (LGD)** it is defined as the percentage of the exposure at risk that is not expected to be recovered in the event of default (7 years)
 - **Exposure at default (EAD)** is defined as the amount of outstanding debt at the time of customer default
 - **Credit term (M)**

THE STANDARD METHOD

- 1) sovereign risks, for example public debt;
- 2) debt of public companies that don't belong to the central administration;
- 3) multilateral loans to development banks;
- 4) interbank credits;
- 5) loans to stock brokers;
- 6) loans to companies;
- 7) loans included in the retail portfolio for regulatory purposes;
- 8) loans secured by residential real estate;

- 9) loans secured by commercial real estate;
- 10) delinquent loans;
- 11) higher risk categories;
- 12) other assets;
- 13) off-balance sheet items.

The number of **risk bands** increases considerably by dividing the 13 groups into secondary bands based on Moody's, S&P or other ratings. For example, in the first group, labeled as sovereign risks, there are five bands: **0% from AAA to AA-; 20% from A+ to A-; 50% from BBB+ to BBB-; 100% BB+ to B-; and 150% for credits below B- or without a grade**

THE STANDARD METHOD

CREDIT RISK

BASEL II

Risk Bands	Rating	percentage
Sovereign risks such as public debt	AAA to AA-	0%
	A+ to A-	20%
	BBB+ to BBB-	50%
	BB+ to B-	100%
	Below B- or not rated.	150%

INTERNAL METHODS

They are based on four parameters; probability of default (PD), Loss given default (LGD), exposure at default (EAD), credit term (M)

$$K = \left[LGD \times N \left(\frac{G(PD) + \sqrt{R} \times G(0.999)}{\sqrt{1-R}} \right) - (LGD \times PD) \right] \times \left[\frac{1 + (M - 2.5) \times b}{1 - 1.5 \times b} \right]$$

Donde:

$N(x)$ es = la distribución acumulada normal estándar.

$G(z)$ = denota la función de distribución acumulada inversa, es decir, es el valor de x tal que $N(x) = z$.

M = es el vencimiento efectivo. La correlación R y un ajuste por vencimiento b están dados por:

$$R = \frac{0.12' (1 - e^{-50' PD}) + 0.24' [1 - (1 - e^{-50' PD})]}{1 - e^{-50}}$$

$$b = [0.11852 - 0.05478 \times \ln(PD)]^2$$

IRB-AIRB. CREDIT RISK

INDICADORES CUANTITATIVOS	IRB BASICO	IRB AVANZADO
Probabilidad de incumplimiento (PD)	Entidad	Entidad
Pérdida en caso de incumplimiento (LGD)	Supervisor	Entidad
Exposición al incumplimiento (EAD)	Supervisor	Entidad
Vencimiento efectivo (M)	Supervisor	Entidad

In the basic approach, **only one of the indicators** is **calculated by the financial entity**, the rest are calculated by the supervisory entity. On the other hand, the **advanced approach** allows the estimation of the **4 parameters** by the financial entity.

BASEL ACCORD II

- **Market risk measurement**
 - Standard method
 - Internal models based on VaR (Value at Risk)

MARKET RISK

- Standard models

This method breaks down assets into different risk categories and assigns predetermined weighting **factors according to their volatility.**

Asset Type	Market Value (USD)	Risk Factor (%)	Capital Required (USD)
Government Bonds (5-year maturity)	50,000,000	2%	1,000,000
Corporate Bonds (10-year maturity)	30,000,000	8%	2,400,000
Listed Stocks	20,000,000	12%	2,400,000
Net Foreign Exchange Position	10,000,000	8%	800,000
Commodity Futures	5,000,000	15%	750,000
TOTAL	115,000,000		7,350,000

MARKET RISK

- Internal models
 - Daily VaR estimation (Value at Risk)
 - With 99% confidence
 - 10 day maintenance period
 - Minimum history of 1 year to calculate them
 - There isn't a special model
 - Tensión and stress tests

BASEL ACCORD II

- **Operational risk measurement**
 - Basic indicator method
 - Standardized method
 - Internal advanced models

OPERATIONAL RISK

- Basic indicator approach. 15% of the income of the last three years with income greater than zero

$$K_{OR - BIA} = \alpha \cdot \frac{\sum_{t=1}^3 \max[IB_t; 0]}{n} \quad (2)$$

15% to all lines of business income

Donde,

K_{OR-BIA} : requerimientos de capital por riesgo operacional, según BIA;

α : factor fijo de 15%;

IB_t : ingreso bruto anual del año t anterior;

n: número de años, dentro de los tres últimos, con ingresos brutos anuales positivos.

- Standardized indicator approach. Divides income into 8 lines of business

$$K_{OR - TSA} = \frac{\sum_{t=1}^3 \max \left[\sum_{j=1}^8 (IB_{j,t} \cdot \beta_j); 0 \right]}{3} \quad (3)$$

Different percentages for each line of business income

Donde,

K_{OR-TSA} : requerimientos de capital por riesgo operacional, según TSA;

β_j : factor fijo para la línea de negocio j-ésima

$IB_{j,t}$: ingreso bruto anual de la línea de negocio j-ésima en el año t

OPERATIONAL RISK

- **Standardized indicator approach**

Línea de Negocio		Factor Fijo
j	Nombre	
1	Finanzas empresariales o corporativas	18%
2	Negociación y ventas	18%
3	Pagos y liquidación	18%
4	Servicios de agencia	15%
5	Administración de activos	12%
6	Intermediación minorista	12%
7	Banca minorista	12%
8	Banca comercial	15%

OPERATIONAL RISK

- Examples
 - Basic Indicator approach

BIA		Ingreso Anual Bruto (GI)					
	Líneas de negocio	2005	2006	2007	Promedio	Factor α	Capital Requerido
	Ingresos Brutos Anuales Positivos	15,620	17,977	22,321	18,639	15%	2,797
Total		15,620	17,977	22,321	18,639		2,797

- Advanced Indicator approach

STDAOp		Ingreso Anual Bruto (GI)					
	Líneas de negocio	2005	2006	2007	Prom.	Factor β	Capital Requerido
1	Finanzas Corporativas	0	0	30	10	18%	2
2	Negociación y ventas	565	781	1,846	1,064	18%	192
3	Pagos y liquidación	755	918	1,062	912	18%	164
4	Banca comercial	4,532	5,035	6,226	5,264	15%	790
5	Servicios de agencia	-	-	-	-	15%	0
6	Banca minorista	9,600	11,096	12,994	11,230	12%	1,348
7	Administración de activos	169	147	183	166	12%	20
8	Intermediación minorista	-	-	-	-	12%	0
Total		15,620	17,977	22,341	18,639		2,515

OPERATIONAL RISK

Advanced models approach: it requires the **accumulation of data on the losses** in each of **the eight lines** of business.

Lines of business	Risks
1....8	Internal fraud
	External fraud
	occupational hazards
	Risks on customers or products
	Damage to tangible assets
	System failures
	Failures in process management

- Find the probability distributions
- The committee decided to only conceptualize the **AMA** method, which has allowed industry and academia to adopt it with increasingly advanced, complex and flexible methodologies.

CAPITAL REQUIREMENTS; BASEL II

$$\frac{\text{Capital Total}}{\text{APR}_C + 12,5 \cdot K_{OR} + 12,5 \cdot RM} \geq 8\% \quad (1)$$

Donde,

APR_C : activos ponderados por riesgo de crédito

K_{OR} : requerimiento de capital por riesgo operacional

RM : riesgo de mercado

It is multiplied by 12.5 because Basel II expresses capital requirements as 8% of risk-weighted assets and, mathematically, $1/0.08=12.5$

BASEL III

- **Northern Rock Bank**
- https://www.youtube.com/watch?v=UjW14_XhAYg

Si una IA hoy puede explicar Basilea III con seguridad, eso no significa que hubiera detectado la crisis de 2008. La regulación nace de errores reales, no de explicaciones elegantes.

BASEL III

- Published in **December 2010**
- It arises as a measure of the **2007-2009 crisis** and constitutes a corrective to what was not considered important before those dates, especially in the areas of quality and sufficiency of capital, **liquidity risk, and leverage**.
- **Credit, market and operational risks** are considered again.
- The minimum capitalization index that banks must maintain is 10.5%. (Capital conservation buffer: An additional 2.5% of capital was added to absorb losses during crises.)
- **Systemic banks** are asked for **an extra percentage**

BASEL III

- The regulatory authority of each country will determine a **supplementary percentage of counter-cyclical** capital that is defined according to its economic situation.
- A **leverage ratio** takes the available capital and divides it by the total assets. The banks were expected to maintain a leverage ratio in excess of 3% (Por cada 100 dolares de activos, el banco debe mantener al menos 3 dolares en capital nivel 1, para evitar el endeudamiento excesivo)
- The crisis showed the importance not only of adequate levels of capital, but also of **having liquidity**. Therefore, two indicators were established for this purpose:
 - CCL (LCR) is the **liquidity coverage ratio**, which was designed to promote resilience against potential liquidity disruptions over a 30-day period.
 - CFEN (NSFR) is the **net stable funding ratio**, which requires banks to maintain a minimum of stable funding sources in accordance with the liquidity profiles of their assets

Both must be greater **than 100%**

LIQUIDITY RISK

- **Indicator 1: liquidity coverage ratio**

$$LCR = \frac{\text{Existencia de activos líquidos de alta calidad}}{\text{Salidas netas de efectivo en los siguientes 30 días}}$$

Garantiza que los bancos tengan suficientes activos líquidos para resistir crisis a corto plazo.

LCR, always greater than 100.
That is, the pool of high-quality assets must be **at least** equal to the potential net cash outflows in a stress situation in the next 30 days.

LIQUIDITY RISK

- **Indicator II: Net stable funding ratio**

$$NSFR = \frac{\text{Cantidad disponible de fondeo estable}}{\text{Cantidad requerida de fondeo estable}}$$

Asegura estabilidad de la estructura de financiamiento a largo plazo.

Research

1. How is the liquidity coefficient of Mexican Banks?

Las acciones de los bancos mexicanos caen a causa del nerviosismo global

El regulador bancario en México, la CNBV, dijo que “los bancos que operan en México cuentan con solidez en sus niveles de capitalización, liquidez y calidad en su cartera de crédito”

ISABELLA COTA

México - 15 MAR 2023 - 10:29 CST

Fernanda Murillo

Ciudad de México, México / 15.01.2024 18:18:00

La calificadora Fitch Ratings consideró que los bancos de México iniciarán 2024 con buena capitalización y liquidez para enfrentar al crecimiento esperado y a los riesgos remanentes de tasas de interés e inflación altos.

Banca, incluido Banco Azteca, tiene capital y liquidez para afrontar riesgos: Banco de México

Axis negocios

[Compartir](#)

La banca en el país mantiene niveles de capital y liquidez suficientes para enfrentar escenarios adversos, en un entorno de condiciones financieras apretadas, elevada inflación y aversión al riesgo, dijeron funcionarios de Banco de México.

La banca en el país mantiene niveles de capital y liquidez suficientes para enfrentar escenarios adversos, en un entorno de condiciones financieras apretadas, elevada inflación y aversión al riesgo, dijeron funcionarios de Banco de México.

Victoria Rodríguez, la gobernadora de ese Instituto Central, agregó que el sistema financiero está actualmente en una posición sólida y de resiliencia, lo que le permitiría afrontar los riesgos que consideran las pruebas de estrés del regulador monetario, sin que sus niveles de capitalización se vean seriamente afectados.

Las pruebas de estrés contemplan desde una desaceleración de la actividad económica global y una recesión en Estados Unidos, hasta un ajuste en la nota crediticia de México y de la empresa estatal Petróleos Mexicanos (Pemex), así como un periodo prolongado de condiciones financieras astringentes en el mundo.

Si bien la banca está en una situación de holgura y las posibles vulnerabilidades se mantienen acotadas, la gobernadora reconoció que dichos riesgos prevalecen y "podrían afectar el buen funcionamiento del sistema en caso de ocurrir".

“Toda información publicada en medios de comunicación y redes sociales respecto de afectaciones a la situación financiera de Banco Azteca es falsa, y por ende no existe un impacto o afectación en la situación financiera de Grupo Elektra”, dijo la compañía, en un comunicado enviado a la Bolsa Mexicana de Valores.

Antes de que la propia empresa y Banco de México echaran por tierra los rumores sobre Banco Azteca, Axis negocios reportó que dichos rumores **no tenían fundamento**.

Elektra agregó que, de acuerdo con el Panorama Anual de Inclusión Financiera 2023 de la CNBV, Banco Azteca contaba con un nivel de capitalización --un indicador que mide el capital neto frente al requerimiento total de capital por riesgos-- de 14.57% al 30 de septiembre, así como un coeficiente de cobertura de liquidez de 945%.

¿Qué es el CESF?

El Consejo de Estabilidad del Sistema Financiero es una “instancia de evaluación, análisis y coordinación de autoridades en materia financiera”, creado mediante decreto presidencial del 29 de julio de 2010. Su mandato es “propiciar la estabilidad financiera, evitando interrupciones o alteraciones sustanciales en el funcionamiento del sistema financiero y, en su caso, minimizar su impacto cuando éstas tengan lugar”. Con esta medida el Gobierno mexicano se insertó en la tendencia internacional más reciente en materia de coordinación y supervisión financiera, atendiendo así las recomendaciones del G20.

El Consejo está integrado por representantes de la [Secretaría de Hacienda y Crédito Público](#), la [Comisión Nacional Bancaria y de Valores](#), la [Comisión Nacional de Seguros y Fianzas](#), la [Comisión Nacional del Sistema de Ahorro para el Retiro](#), el [Instituto para la Protección al Ahorro Bancario](#) y el [Banco de México](#). La presidencia del Consejo recae en la Secretaría de Hacienda y su secretaría en el Banco de México.
